

SMART INDIA HACKATHON 2025

TITLE PAGE

☐ Problem Statement ID: **25042**

☐ Problem Statement Title:

**Identifying Taxonomy and Assessing
Biodiversity from eDNA Datasets**

☐ Theme: **Miscellaneous**

☐ PS Category: **Software**

☐ Team ID: **56745**

☐ Team Name: **GENOMIKS**

Our Idea:

A cloud-based AI-powered pipeline that takes raw eDNA data and outputs Species Taxonomy + Biodiversity Health Report.

How its Innovative?

The solution's key uniqueness is its ability to produce a user-friendly biodiversity health report in an easily digestible format.

Our 5 Step Solution

1. **Data Input** : Upload raw eDNA sequencing files.
2. **Preprocessing & Noise filtering** : Remove low-quality reads, sequencing errors, and contamination.
3. **Taxonomy Identification** : Integrate a deep learning model trained on reference genomes. Comparison against reference databases.
4. **Biodiversity Assessment** : Calculate indices and species. Detect invasive/endangered species.
5. **Visualization Dashboard** : Interactive UI, Species list, Graphs and options to export reports as PDF or CSV.

Methodology & Required Technologies

Our Prototype

Matching Species

Species Image	Species Name	Taxonomy
	1. Hadal Snailfish (Pseudoliparis spp.)	Kingdom: Animalia Phylum: Chordata Class: Actinopterygii Order: Scorpaeniformes Family: Liparidae Genus: Pseudoliparis Species: Pseudoliparis spp.
	2. Dumbo Octopus (Grimpoteuthis spp.)	Kingdom: Animalia Phylum: Mollusca Class: Cephalopoda Order: Octopoda Family: Opisthoteuthidae Genus: Grimpoteuthis Species: Grimpoteuthis spp.
	3. Sea Cucumber (Holothuridea spp.)	Kingdom: Animalia Phylum: Echinodermata Class: Holothuroidea Order: (Varies) Family: (Varies) Genus: Holothuridea Species: Holothuridea spp.
	4. Amphipods (Dephnia dephnia)	Kingdom: Animalia Phylum: Chordata Class: Mammalia Order: Artiodactyla Family: Delphinidae Genus: Delphinus Species: D. delphis

Biodiversity

Species Image	Species Name	Relative Reads (%)	Ecological Role
	Hadal Snailfish (Pseudoliparis spp.)	15%	Scavenger/Predator Highly adapted to extreme pressure and low oxygen. Feeds on detritus and small invertebrates. Often top predators in trench environments.
	Dumbo Octopus (Grimpoteuthis spp.)	5%	Benthic Predator Feeds on small crustaceans and worms on the seafloor. Adapted to cold, high-pressure, and low-light conditions.
	Sea Cucumber (Holothuridea spp.)	20%	Detritivore/Deposit Feeder Filters organic matter from sediments. A key component of abyssal plain communities, recycling nutrients from falling marine snow.
	Amphipods (Amphipoda spp.)	10%	Scavenger/Detritivore Abundant in deep-sea, particularly in response to food falls. Important link in the detrital food web.

FEASIBILITY ANALYSIS

- Existing tools are slow, complex, and require expertise. Our system offers a fast, scalable, and affordable alternative by leveraging cloud resources.
- The algorithm directly aids biodiversity conservation, making it useful for government agencies, NGOs, researchers, and local communities.

VIABILITY ANALYSIS

Potential Challenges and Solutions:

- ☐ **Large Data Size:** Processing raw sequencing files is computationally heavy.
✓ **Solution:** Use of k-mer based classification for faster matching.
- ☐ **Accuracy of Taxonomy Identification:** Short DNA fragments propose a misclassification risk.
✓ **Solution:** Hybrid approach and regular updates from global databases.
- ☐ **Limited Bioinformatics Expertise Among End Users:** Biologists/NGOs cannot handle raw command-line tools.
✓ **Solution:** Intuitive dashboard UI, Auto-generate Biodiversity Reports.

IMPACTS

**Environmental impact:**

Enables real-time monitoring of ecosystems and Helps detect endangered, invasive, or extinct species faster.

Societal & Community impact:

Assists fishermen, farmers, and local communities by detecting ecosystem health early. Creates awareness among citizens about India's biodiversity wealth.

Economic impact:

Cost-effective solution for government agencies, NGOs, and industries monitoring biodiversity. Supports eco-tourism and natural resource management by ensuring healthy ecosystems.

BENEFITS

**Non-invasive monitoring:**

No need to capture or disturb organisms; biodiversity can be tracked from water/soil/air samples.

**High accuracy:**

Detects even hidden, rare, or microscopic species that traditional surveys miss.

**Scalability:**

Works for local rivers as well as large marine ecosystems using cloud infrastructure.

**User-friendly platform:**

Biologists, NGOs, and policymakers can use it without deep bioinformatics knowledge.

**Supports National missions:**

Contributes to India's biodiversity, climate, and sustainability goals.
